

## ***Expression of Interest (EOI)***

Hello sir, Happy to help with making your web app design - looks like you need to get a design for your web app using HTML, CSS and JavaScript. I'd recommend using React JS as it's a great library that is suited for your situation. It is a powerful library that is optimal for fetching data which is rapidly changing and a component-based front-end library. I am a full-stack web app developer with 2 years of experience with 10+ clients in the US. I've worked in a similar project before it was a very good experience for me and the results impressed the client. I have made Single Page Web sites as well as complex Web Applications using React JS. In my point of view here are the things that your project needs to be done:

- Designed to make it responsive and user-friendly to the patient using CSS and bootstrap.
- Building main components using react js that show every patient info in a stable way.
- Setting API requests to manage data.
- All data should be encrypted and transferred to authorized users only through a secured channel.
- The project should be tested to check if there any leak of data or bugs found to fix them.

It will be a pleasure working on this project. Let me know if you'd like to chat.
